

AMENDMENTS TO THE CLAIMS:

1. (Currently Amended) A method for centralizing administration of user registration information across networks, characterized by: including at least an Internet Content Provider (ICP) and a user-login-identification means which can access an online terminal; wherein the ICP adds an interface module in a login web page and accesses the user-login-identification means via the interface module, and the ICP also provides an administration/drive module monitoring access of the user-login-identification means to set up a connection and hang up the connection for the user-login-identification means in the login web page; the user-login-identification means is provided with an ID number, and user's login identification information is stored in the user-login-identification means; ICP access authentication information is stored in the user-login-identification means to verify whether the accessing ICP is authorized to access; if the accessing ICP passed the verification, its access is permitted, otherwise the access is not permitted; wherein the ICP is permitted to access the user-login-identification means only if the ICP ~~it~~ is authenticated, when the user-login-identification means is activated; authenticating comprises, obtaining an authentication file via the interface module, transmitting the authentication file to the administration/drive module, decrypting the authentication file by the administration/drive module, and accessing the user-login-identification means.
2. (Currently Amended) The method of claim 1, wherein the administration/drive module is used to ~~can also~~ lead in and/or lead out data stored in the user-login-identification means so as to backup the data; the administration/drive module is used to ~~can also~~

automatically log in, in the case that the ICP accesses the user-login-identification means via the interface module and verifies the identification information.

3. (Original) The method of claim 1, wherein the ICP accessing the user-login-identification means includes checking the user ID identification information stored in the user-login-identification means, or generating the user ID identification information in the user-login-identification means.
4. (Original) The method of claim 3, wherein the ICP reads the information stored in the user-login-identification means, and if login identification information is obtained, the interface module returns the login identification information to the ICP web page and determines whether a login-submit or an automatic submit & login should be performed according to user's setup; if the login identification information is not obtained, the interface module informs the web page that the login identification information is not available and stores the generated login identification information in the user-login-identification means.
5. (Original) The method of claim 4, wherein an ICP web page is provided with a registration information window; the ICP invokes parameters of the interface module and simultaneously saves several sets of registration information of a same web page or saves the last set of registration information in the user-login-identification means, and the registration information can also be displayed on the ICP web page.
6. (Original) The method of claim 5, wherein the an ICP web page is provided with a registration information window; the ICP accesses the user-login-identification means via the interface module and verifies the login identification information provided by

the ICP web page, and stores new login identification information in the user-login-identification means to overwrite original login identification information, and transfers relating information to the ICP web page; the information is displayed on the web page after being obtained.

7. (Original) The method of claim 5, wherein the ICP web page is provided with a plurality of window links of the registration information; the ICP reads the user-login-identification information stored in the user-login-identification means and verifies the login identification information provided by the ICP web page; if verification appears negative, the login identification information is stored in the user-login-identification means, and if positive, the login identification information is directly read out and the relating information is transferred to the ICP web page; the information is displayed on the web page after being obtained.
8. (Original) The method of claim 1, further includes a login verification serving party for implementing prior authentication to the ICP and obtaining guide information of the user-login-identification means.
9. (Currently Amended) The method of claim 1, wherein the ICP is connected with a login verification serving party which transmits a code for accessing the user-login-identification means to the ICP, and the ICP adds the login identification information in the login web page according to the code, and the interface module transmits the ICP information to the login verification serving party for verification; if the ICP information passes ~~passed~~ the verification, the ICP is permitted to access the user-login-identification means, wherein the user activates the user-login-identification

means by using a password, and then the ICP accesses the login verification serving party for an authentication via the interface module; if the authentication is valid, the ICP can operate the user-login-identification means via the interface module and the actuating password used by the user is provided by the login verification serving party or preset in the means; the encryption files of the ICPs transmitted by the login verification serving party are different from each other.

10. (Currently Amended) A system for realizing the method for centralizing administration of user registration information across networks, ~~characterized by,~~ comprising a computer, Internet networks, at least an ICP and a user-login-identification means, wherein the computer is used for logging, ~~can log~~ in the Internet networks to communicate with different ICPs; the user-login-identification means is ~~enable of~~ for accessing the computer from outside and has at least an identification number and encryption storage space; and the user-login-identification means performs the information transmission by operating the computer.
11. (Currently Amended) The system of claim 10, wherein the ICP is connected with a login verification serving party which transmits a code for accessing the user-login-identification means to the ICP, and the ICP adds the login identification information in a the login web page according to the code, and an the interface module transmits the ICP information to the login verification serving party for verification; if the verification is valid, the ICP is permitted to access the user-login-identification means, and the login verification serving party is a server.
12. (Currently Amended) The system of claim 10, wherein information transmission

between the computer and the user-login-identification means ~~is should be~~ processed with encryption or decryption; the encryption includes protecting an encryption area by using the user's PIN code or utilizing RSA 512PKI key management encryption method.

13. (Original) The system of claim 12, wherein the user-login-identification means is also provided with a storage region for storing the information of the ICP itself.
14. (Original) The system of claim 13, wherein the user-login-identification means is an external and portable memory means with a standard data interface, or a card-reader means or an ID identifying means thereof .
15. (Currently Amended) The system of claim 14, wherein the user-login-identification means ~~is can be~~ a USB storage device, a CF card, a MMC card, a SD card, a SMC card, an IBM Micro Drive card, a flash storage module or an IC card.
16. (Currently Amended) The system of claim 14, wherein the portable memory card-reader means ~~is can be~~ a CF card processor, a MMC card processor, a SD card processor, a SMC card processor, an IBM Micro Drive card processor or an IC card processor.
17. (Currently Amended) The system of claim 13, wherein the user-login-identification means is a computer peripheral, ~~such as a keyboard, a mouse, a handwriting board or sound boxes.~~
18. (Original) The system of claim 13, wherein the user-login-identification means is a portable PDA, a music player or an electrical dictionary.
